

Here's a detailed documentation for the filters and actions used in the code you provided. This documentation will help developers understand how to use and extend the functionality provided by these hooks.

Giftify Plugin Developer Documentation

This documentation covers various filters and actions available in the Giftify plugin, allowing developers to extend the plugin's functionality by adding custom options, tabs, and content.

1. Filter: `giftify_select_options`

This filter allows developers to add custom options to a select field within the Giftify plugin.

Usage Example:

```
add_filter('giftify_select_options', 'add_developer_option');
function add_developer_option($options) {
    $options['developer'] = __('Developer', 'giftify');
    return $options;
}
```

Parameters:

- **\$options** (array): An associative array of existing options where the key is the option value and the value is the option label.

Return:

- **array**: The modified array of options, including any custom options added by the developer.

Description:

By using this filter, developers can add their own options to the select field. In the example above, an option labeled “Developer” is added.

2. Filter: `giftify_additional_tabs`

This filter allows developers to add custom tabs to the Giftify settings page.

Usage Example:

```
add_filter('giftify_additional_tabs', function($tabs) {  
    $tabs['custom_tab'] = 'Custom Tab';  
    return $tabs;  
});
```

Parameters:

- **\$tabs** (array): An associative array of existing tabs where the key is the tab identifier and the value is the tab label.

Return:

- **array**: The modified array of tabs, including any custom tabs added by the developer.

Description:

This filter enables the addition of custom tabs to the settings page. The example adds a tab labeled “Custom Tab” with the identifier `custom_tab`.

3. Action: `giftify_tab_content_{tab_id}`

This action allows developers to define the content for custom tabs added to the Giftify settings page.

Usage Example:

```
add_action('giftify_tab_content_custom_tab', function() {  
    echo '<h2>Custom Tab Content</h2>';  
    echo '<p>This is the content for the custom tab.</p>';  
});
```

Parameters: None

Description:

This action is used to output content for a custom tab. In the example, the action `giftify_tab_content_custom_tab` is used to output content for the tab with the identifier `custom_tab`.

4. Filter: `giftify_fee_type_options`

This filter allows developers to add custom options to a fee type select field within the Giftify plugin.

Usage Example:

```
add_filter('giftify_fee_type_options', function($options) {  
    $options['custom_fee'] = __('Custom Fee', 'giftify');  
    return $options;  
});
```

Parameters:

- **\$options** (array): An associative array of existing fee type options where the key is the option value and the value is the option label.

Return:

- **array**: The modified array of fee type options, including any custom options added by the developer.

Description:

This filter allows developers to introduce new fee types into the select field used for fees. In the example above, a custom fee type labeled “Custom Fee” is added.

Conclusion

These filters and actions provide powerful ways for developers to extend the Giftify plugin by adding custom options, tabs, content, and fields. By following the provided examples, developers can easily integrate their custom functionality within the plugin’s framework.

Note: Always ensure that the custom identifiers and labels used are unique and do not conflict with existing options or fields within the plugin.
